                                                                                                                                                                                                                         FUNCTION: CONTROLS THE EXPRESSION OF GENES INVOLVED IN ANTHOCYANIN BIOSYNTHESIS. REGULATES THE EXPRESSION OF AT LEAST 3 STRUCTURAL GENES: CHALCONE SYNTHASE, DIHYDROPLAVONOL REDUCTASE AND FLAVONOL O(3) GLUCOSYLTRANSFERASE. C1 ACTS AS A TRANS-ACTING FACTOR. SUBCELLULAR LOCATION: Nuclear (Probable).

MISCELLANBOUS: THE C1-I ALLELE IS A DOMINANT NEGATIVE MUTANT WHICH INHIBITS PIGMENT FORMATION.
                                                                                                                                                                       s SWISS-PROT entry is copyright. OJ. 6:3553-3558(1987).

FUNCTION: CONTROLS THE EXPRESSION OF AT LEAST 3 STRUCTURAL BIOSYNTHESIS. REGULATES THE EXPRESSION OF AT LEAST 3 STRUCTURAL GENUS: CHALCONE SYNTHASE, DIHYDROPLAVONOL REDUCTASE AND FLAVONOL O(3) GLUCOSYLTRANSFERASE. C1 ACTS AS A TRANS-ACTING FACTOR. SUBCELLULAR LOCATION: Nuclear (Probable).

SIMILARITY: Contains 2 Myb-like domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    BIND

EVINCTION: THE PROTEASOME IS A MULTICATALYTIC PROTEINASE COMPLEX WHICH IS CHARACTERIZED BY ITS ABILITY TO CLEAVE PEPTIDES WITH ARG, PHE, TYR, LEU, AND GLU ADJACENT TO THE LEAVING GROUP AT NEUTRAL OR SLIGHTLY BASIC PH. THE PROTEASOME HAS AN ATP; DEPENDENT PROTEOLYTIC ACTIVITY (BY SIMILARITY).

CATALYTIC ACTIVITY: Cleavage at peptide bonds with very broad
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       proteolytic pathway.
